TCP/IP Protocol Suite and Network Devices

Design Goals of TCP/IP

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

- The TCP/IP reference model was developed prior to OSI model.
The major design goals-
1. To connect multiple networks together so that they appear as a single network.
 2. To survive after partial subnet hardware failures.
 3. To provide a flexible architecture

Protocol and Its Elements

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

- It is a set of rules that govern data communication.
- Define What, How and When in terms of data communication

- **Syntax**
 - Structure or format of the data
 - Indicates how to read the bits - field delineation
- **Semantics**
 - Interprets the meaning of the bits
 - Knows which fields define what action
- **Timing**
 - When data should be sent
 - Speed at which data should be sent or speed at which it is being received.

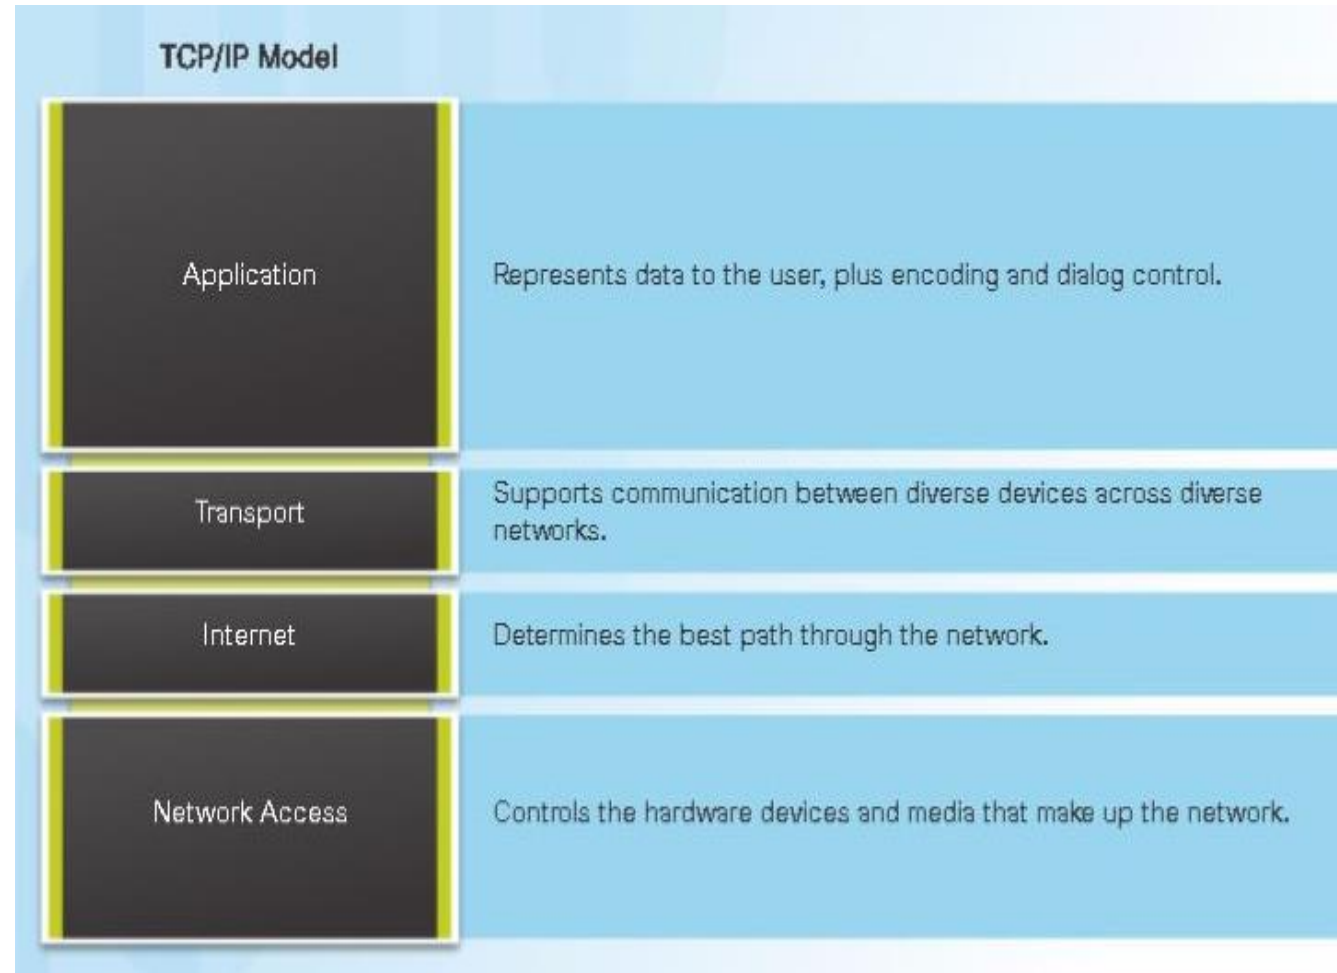

- The **Internet Protocol Suite** (commonly known as **TCP/IP**) is the set of communications protocols used for the Internet and other similar networks.
- Named from two of the most important protocols
 - Transmission Control Protocol (TCP) and
 - Internet Protocol (IP)

TCP/IP PROTOCOL SUITE

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

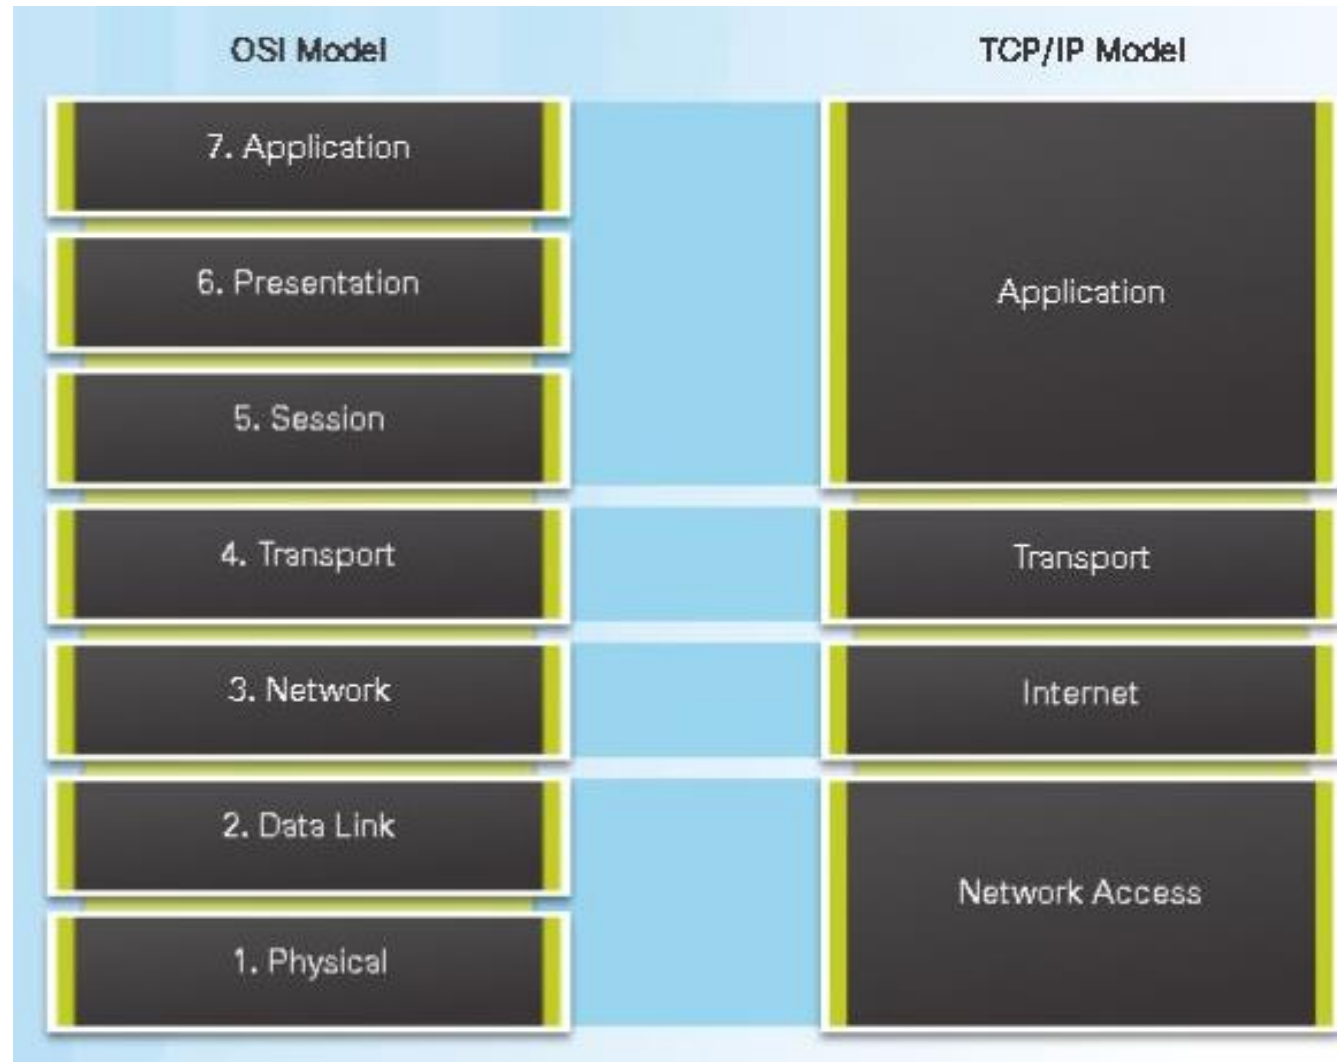

- The layers in the TCP/IP protocol suite do not exactly match those in the OSI model.
- The original TCP/IP protocol suite was defined as having four layers:
 - Host-to-network/Network access
 - Internet
 - Transport
 - Application.

TCP/IP vs OSI

Protocols in TCP/IP Model

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

IP- Internet Protocol

ARP- Address Resolution Protocol

RARP- Reverse Address Resolution Protocol

ICMP- Internet Control Management Protocol

IGMP- Internet Group Management Protocol

SCTP- Stream Control Transmission Protocol

TCP- Transmission Control Protocol

UDP- User Datagram Protocol

SMTP- Simple Mail Transfer Protocol

FTP- File Transfer Protocol

HTTP- Hyper Text Transfer Protocol

DNS- Domain Name System

SNMP- Simple Network Management Protocol

Network Devices

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

1. **Hub**- A distributor that has many ports which connected to computers.
2. **Switches**- Like a hub but it transmit packets to it destination
3. **Bridge**- It is used to connect two similar LANs.
4. **Routers**- Choose the best path to transmit the packet.
5. **Gateway**- It is used to connect two deferent LANs and connect different application protocols.
6. **Firewall**- A s/w program or h/w device (or combination of both) protects the device or network from unauthorized access by blocking unsolicited traffic.
7. **Repeaters**- Repeats signals that travels via long distance

- Repeater: Re-generates the signal again.

a. Right-to-left transmission.

b. Left-to-right transmission.

Network Devices (Hub and Bridge)

Network devices at different Layer

BENNETT
UNIVERSITY
TIMES OF INDIA GROUP

Layers	Network Devices
Application Layer	Application gateway
Transport Layer	Transport gateway
Network Layer	Router and gateway
Data link layer	Bridge and Switch
Physical Layer	Repeater and Hub
